

PRODUCT DESCRIPTION

D1550SC

HASLE D1550SC is a low cement castable based on a combination of Andalusite, Mullite and SiC.

It is a good all-round choice for cement factories that favor SiC in their refractory design. The SiC content of 17% can also be utilized in boilers, where heat transfer is needed.

The balanced chemical content and low porosity gives D1550SC a good overall chemical resistance. The photo below shows a crucible cut in half for inspection after a 1100°C test with a combination of reagents including alkalis and Sulphur.
