

Product description HASLE Traditional castables

Bs1200, Bs1300 and B1500

HASLE offers a range of traditional, cement bonded castables. All are chamotte based and generally easy to work with because of the high cement content.

Traditional castables are good for repairs for e.g., solid fuel applications and smelters. Traditional castables can also be used as wear lining in lower impact applications without special demand for high mechanical strength or chemical resistance.

Installation and mixing can be done with simple tools but using quality mixers and vibrators will improve the final result.

Cs1500 for dry gunning

HASLE also offer a traditional dry gunning product based on Andalusite.
