

5-YEAR LINING LIFETIME IN CYCLONE BULL NOSE

Australian cement plant achieves 5-year lifetime in Cyclone Bull Nose with HASLE Precast Modular Lining.

One of our valuable customers, a cement plant in Australia which runs on both coal and waste (10%), has achieved an outstanding lifetime of 5 years for the lining in their Vertical Bull Nose in the lowest stage Cyclone.

The Australian cement plant had a problem with short life in the Cyclone Bull Nose, dealing with cracking and abrasion of the gunning material installed. We suggested switching to HASLE's precast Modular Lining, and our team of skilled engineers designed a new element for the corner section with a 60° angle. It was cast at our state-of-the-art plant in Denmark, using our unique castable HASLE D59A.

HASLE's supervisors provided technical support and supervision during the installation in the Vertical Bull Nose for both strings of the lowest stage cyclone.

Recently, the Modular Lining achieved an excellent lifetime of 5 years! It is still in good shape, expected to last an additional one or two campaigns.

Using HASLE's precast Modular Lining is a long-lasting solution. If you are having problems with the lining in high temperature areas of your cement plant, contact us today at info@hasle-refractories.com or call (+45) 5695 1800.
