

MODULAR LINING IN CYCLONE ROOF REACHES +3.5 YEARS

Cement plant reaches +3.5 years lifetime in cyclone roof with precast Modular Lining

In early 2016, a cement plant in France installed 11 m² of HASLE's precast Modular Lining in their cyclone roof. It was cast at our state-of-the-art plant in Denmark, using our unique castable HASLE D59A. After 3.5 years, it is still in operation and in excellent condition.

The lifetime of HASLE's Modular Lining is typically 2-3 times longer than that of an in-situ casted lining. With HASLE's Modular Lining, you will get no coating, and compared to other refractory solutions, our precast

lining even has the possibility of leaving more room in the burn chamber or providing better insulation. Both factors contribute to lowering the CO₂-emission through optimal use of the energy.

Using HASLE's precast Modular Lining is a long-lasting solution. If you are having problems with the lining in high temperature areas of your cement plant, contact us today at info@hasle-refractories.com or call (+45) 5695 1800.
